

Feature Request Guide

How a change to an existing system moves from request to delivery

When to use this request

Use Feature when you need a change, improvement, or addition to a system that already exists.

Request-to-delivery flow

1	Describe the need Explain the current condition, target condition, and benefit. Focus on the need rather than prescribing how ITD should build it.	You
2	Supervisor review The reviewer approves it, rejects it with a reason, or asks you for more information.	Supervisor
3	Capacity scheduling Approved requests are placed into the delivery schedule using real team capacity.	Automatic
4	Work planning ITD breaks the request into estimated tasks and reviews the plan before work starts.	ITD
5	Validate the result Work that only you can judge pauses until you confirm that the result is correct.	You
6	Delivered After the final task and required validation are complete, the request moves to History.	ITD

Before you submit

- Describe the current condition instead of prescribing a technical solution.
- Include how often the issue happens and how much time it consumes.
- Choose the system you actually use, even if you are unsure where the change belongs.
- Use urgent only when waiting creates real operational harm.

Your validation deadline

When ITD finishes work that only you can validate, it appears under Waiting on me. Respond within the validation window shown in Elara. No response cancels the request and releases the capacity slot. Requesting changes is always better than not responding.

Where to follow progress

Monitor progress from My requests. Once delivery starts, use Timeline to see the feature schedule. Respond to validation items under Waiting on me.
